

EVALUATION OF
SENSIBILITY AND
RE-EDUCATION OF
SENSATION IN THE HAND

A. LEE DELLON, M.D.

CONTENTS

<i>Foreword by Raymond M. Curtis, M.D.</i>	V
<i>Foreword by Professor Erik Moberg</i>	VII
<i>Preface</i>	IX
<i>Acknowledgments</i>	XI

Section 1

Back to Basics

Chapter 1. Classics	3
many of the sensory structure/function relationships are based on artifact and antiquity	
Chapter 2. New Morphology	15
a contemporary design for the distal glabrous skin is presented	
Chapter 3. Neurophysiologic Basis of Sensation	27
subdivision of the large myelinated fibers on their properties of adaptation provides the basis for a relevant clinical examination	
Chapter 4. Sensory Corpuscles after Nerve Division	47
their fate is a combination of Wallerian degeneration and loss of trophic influence	
Chapter 5. Sensory Corpuscles after Nerve Repair	65
degenerating corpuscles are reinnervated by regenerating axons	

Section 2

Evaluation of Sensibility

Chapter 6. It's Academic but not Functional	95
the goal is no longer localization of a lesion within the central nervous system	
Chapter 7. Pattern of Sensory Recovery	115
a predictable sequence is observed during reinnervation	
Chapter 8. Moving Two-Point Discrimination Test	123
the majority of hand functions involve fingertip movement. functional sensation is best evaluated with this new test	
Chapter 9. Vibratory Sense and the Tuning Fork	141
vibratory stimuli are mediated through the "touch fibers," and thus are a valuable diagnostic tool	
Chapter 10. Evaluation of Sensibility in the Hand	169
the examination should be based upon neurophysiology and regional anatomy, and be appropriate to the clinical setting	

Section 3

Re-Education of Sensation

Chapter 11. Results of Nerve Repair in the Hand	193
despite refinement in surgical technique, the percentage of excellent results has been low	
Chapter 12. Re-Education of Sensation	203
apply specific sensory exercises at the appropriate time in the recovery process
