Contents

Preface to the Third Edition vii

Preface to the Second Edition ix

Preface to the First Edition xi

1. Injury 1

The two stages of examination are detailed: the initial in the emergency room where decisions are made on closed injuries particularly and where the importance of surface anatomy, careful observation and systematic testing is emphasized: the second, surgical exploration, in which the choice of procedure in open injuries and the identification of all injured deep structures receive special attention.

2. Reconstruction 155

A statement of the eight basic hand functions is followed by an assessment of how each anatomical component – skin, nerves, joints, tendons and vessels – individually and severally may impair performance of those functions and indications of how to correct these impairments.

3. Compression 283

Differing factors produce compression neuropathy and these, together with the common elements of pain, sensory disturbance, motor loss and electrophysiological changes, are discussed before considering individually the compression syndromes which afflict the upper limb.

4. Inflammation 323

Both acute and chronic inflammatory disorders are

described, stress being laid in the former on the significant compartments of the hand and localized and generalized upper extremity infections and in the latter on osteoarthritis and on disturbances of the musculotendinous units.

5. Rheumatoid 355

An account of a system of regional examination which differs from that employed in non-rheumatoid patients is accompanied by those aspects of pathological anatomy which are required to understand the unique deformities of the rheumatoid hand.

6. Swelling 403

A systematic approach to all swellings and ulcers of the hand is presented with details of tumour grading and the diagnostic features of and indications for treatment of fifty-three swellings encountered in the upper limb.

7. Congenital 459

The twenty-seven most common anomalies are considered, particular attention being paid to the nature and timing of surgical intervention.

Appendix: Muscle testing 513

This appendix illustrates the testing of all the muscles of the upper limb.
